

Drone carrier fleets for Europe.

Rocket engineers with 5 years in the armed forces

Sander
CEO

Airframe Lead , Portal Space

Viktor
CTO

Combustion chamber, Portal Space

See our rocket launch: <https://www.youtube.com/watch?v=5Skk7IVMINg>

We launched the rocket and looked to **Ukraine** for the next challenge

Their problem was clear; ranged strikes are not cheap

Problem

FPV drones lack range

\$500 for 20km range

Fixed-wing drones are expensive

\$10,000 for 100km range

Solution

Reusable carrier layer for the cheap, expendable drones

Ship the drones out, deploy, return and reload

Cost per strike

\$10,000 → \$3200

FPV operator reach

20km → 100km

Product

Why now

No one owns the carrier layer

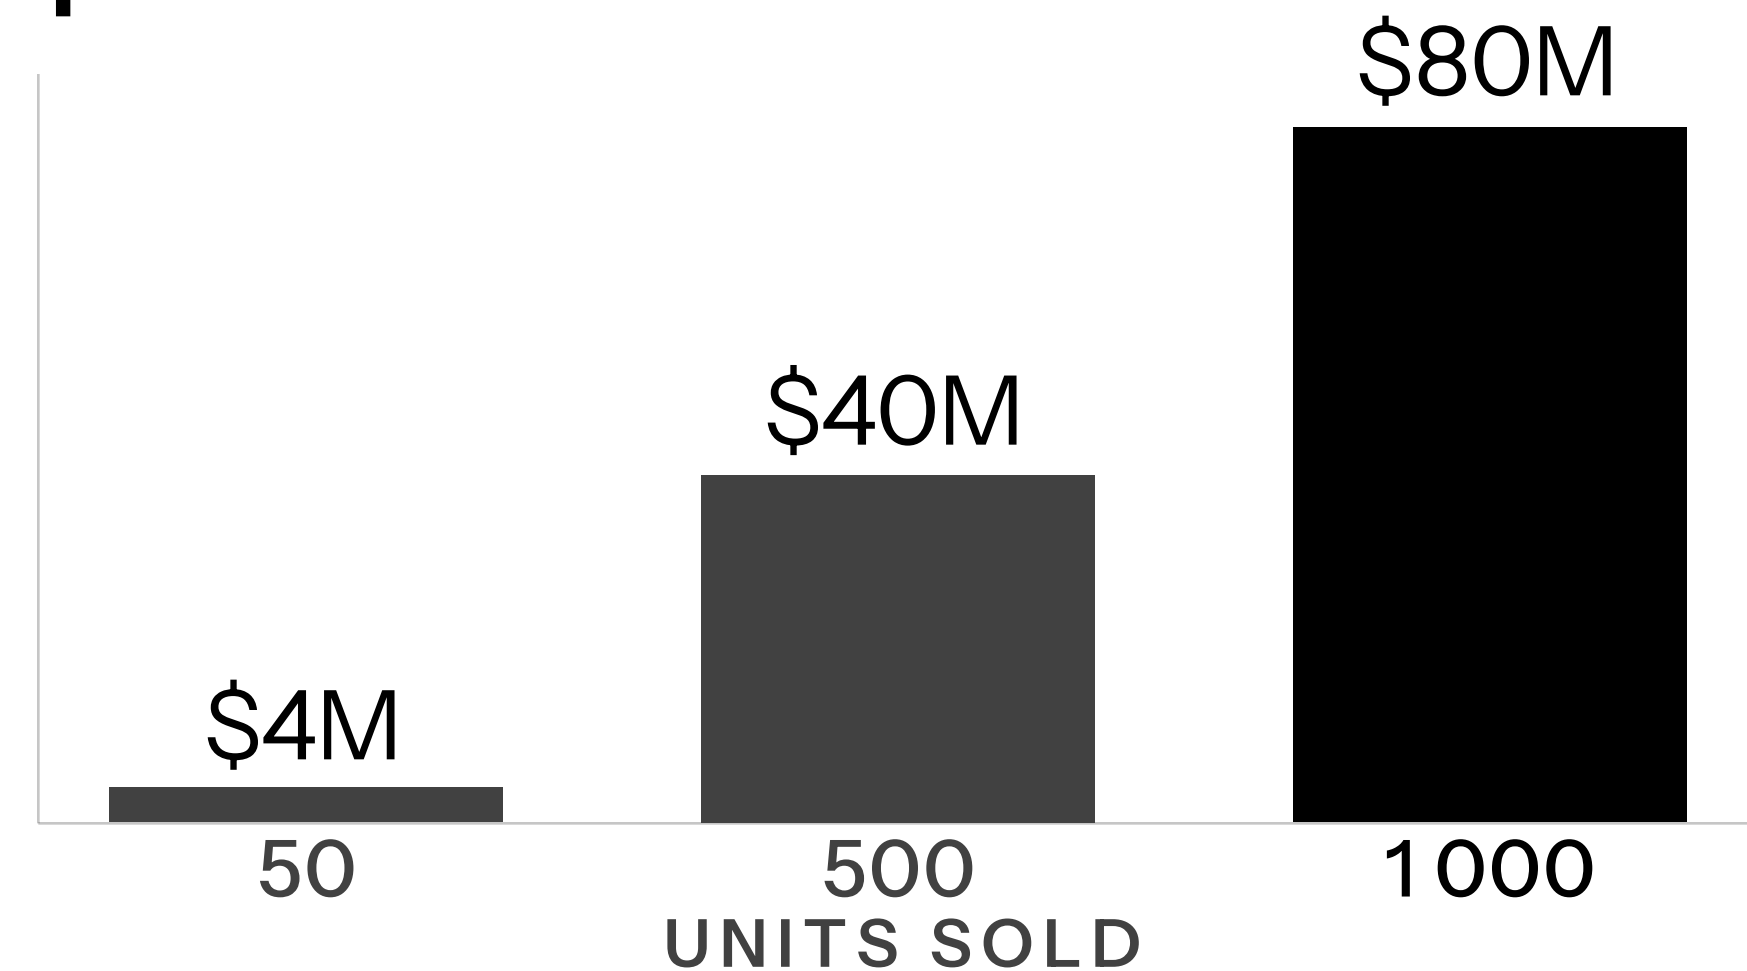

Range is a physical limitation (i.e. you have to have **bigger** systems to reach further) → This can't be solved by software

Every swarm-tech company being funded today will hit the same wall we are solving.

Business model

**We make money by
selling carriers at
\$80k gross profit**

Gross profit

Go to market

01 The frontline

Test, feedback and iterate on the Ukrainian frontline. Yonchi at Mirage Unmanned Systems has agreed to test our systems in combat

02 Ukraine

Sell it to units who need it NOW. Use our unit contacts in Pokrovsk, Kyiv and Kharkiv to expand our customer reach

03 Nordics & Baltics

These states buy on evidence from Ukraine

10 year case

We become layer between **Europe** and the target.

We own the carrier segment at land, air and sea.

First large scale mover in Ukraine. Fleets across NATO.
Every European payload flies on our carriers, through
our interface.

Ask

\$60k

Buys a **working prototype** by December, which gives huge traction into pre-seed in January
